INSTALLATION INSTRUCTIONS
EDELBROCK HEAT INSULATOR CARB GASKETS FOR DUAL QUADS #9267

• CONTENTS: 
  2- Square-bore Heat Insulator Gaskets (0.125” thick)
  8- 5/16” x 1-3/4” carburetor studs

• DESCRIPTION: The Edelbrock Square-bore Heat Insulator Gaskets for Dual Quads are designed to prevent percolation on Edelbrock Performer Series carburetors exposed to extreme underhood temperatures. These gaskets feature 4-hole construction which will allow dual quad manifolds to seal properly to the carburetor. For open plenum manifolds such as the Torker or Victor series, use gasket #9265, which is open in the center.

• INSTALLATION: Prior to installation, check air cleaner-to-hood clearance to ensure that additional height of heat insulator gasket will not cause interference. Remove air cleaner and all attachments to the carburetor such as fuel line, throttle linkage, and vacuum lines. Be sure to note the position or tag each piece to facilitate re-installation. Remove the carburetor and set it aside, then remove the old base gasket and any additional plates. Remove the short carb studs and install the longer studs. Install the heat insulator gaskets directly against the manifold, then replace the carb and all other connections.

• CAUTION: This Gasket Set (#9267) is intended for use on Edelbrock Performer Series Carburetors and Edelbrock dual quad manifolds only. It is not for stock manifolds which have exhaust gas openings at the carb flange.
