INSTRUCTION MANUAL FOR MG160 MIG WELDER

IMPORTANT: BEFORE STARTING THE EQUIPMENT, READ THE CONTENTS OF THIS MANUAL, WHICH MUST BE STORED IN A PLACE FAMILIAR TO ALL USERS FOR THE ENTIRE OPERATIVE LIFE-SPAN OF THE MACHINE. THIS EQUIPMENT MUST BE USED SOLELY FOR WELDING OPERATIONS.

1 SAFETY PRECAUTIONS

WELDING AND ARC CUTTING CAN BE HARMFUL TO YOURSELF AND OTHERS. The user must therefore be educated against the hazards, summarized below, deriving from welding operations. For more detailed information, order the manual.

ELECTRIC SHOCK - May be fatal.
Install and earth the welding machine according to the applicable regulations.
Do not touch live electrical parts or electrodes with bare skin, gloves or wet clothing. Isolate yourselves from both the earth and the workpiece.
Make sure your working position is safe.
FUMES AND GASES - May be hazardous to your health.
Keep your head away from fumes. Work in the presence of adequate ventilation, and use ventilators around the arc to prevent gases from forming in the work area.
ARC RAYS - May injure the eyes and burn the skin.
Protect your eyes with welding masks fitted with filtered lenses, and protect your body with appropriate safety garments.
Protect others by installing adequate shields or curtains.
RISK OF FIRE AND BURNS
Sparks (sprays) may cause fires and burn the skin; you should therefore make sure there are no flammable materials in the area, and wear appropriate protective garments.
NOISE
This machine does not directly produce noise exceeding 80dB. The plasma cutting/welding procedure may produce noise levels beyond said limit; users must therefore implement all precautions required by law.
PACEMAKERS
The magnetic fields created by high currents may affect the operation of pacemakers. Wearers of vital electronic equipment (pacemakers) should consult their physician before beginning any arc welding, cutting, gouging or spot welding operations.
EXPLOSIONS
Do not weld in the vicinity of containers under pressure, or in the presence of explosive dust, gases or fumes. All cylinders and pressure regulators used in welding operations should be handled with care.

ELECTROMAGNETIC COMPATIBILITY
This machine is manufactured in compliance with the instructions contained in the harmonized standard. and must be used solely for professional purposes in an industrial environment. There may be potential difficulties in ensuring electromagnetic
compatibility in non-industrial environments.

IN CASE OF MALFUNCTIONS, REQUEST ASSISTANCE FROM QUALIFIED PERSONNEL.

2 GENERAL TECHNICAL DESCRIPTIONS

2.1 SPECIFICATIONS

This manual has been prepared with the intent of instructing the operator on how to install, operate, and properly maintain this electric arc welding machine.

This machine is a constant voltage power source for MIG/MAG and OPEN-ARC welding.

Upon receiving and unpacking the machine, make a careful inspection to ensure that there are no damaged parts.

Should there be a claim for losses or damages it must be made by the purchaser directly to the shipper who handled the goods.

When requesting information about this welding machine, please state the machine’s part number and serial number to ensure receiving accurate information relating to your machine.

2.2 DESCRIPTION OF TECHNICAL SPECIFICATIONS

MODEL: The model of the machine
EN 60974-X international standards.

SN Machine Serial Number which must appear on requests or inquiries concerning the machine.

Single-phase transformer-rectifier

Three-phase transformer-rectifier

3-50/60Hz Three-phase input supply at 50 or 60 Hz
1-50/60Hz Single-phase input supply at 50 or 60 Hz.

Uo. Secondary no-load voltage (peak value).

X Duty-Cycle Percentage

The duty-cycle is the number of minutes, expressed as a percentage, the machine can operate (arc on) within a ten minute period without overheating. The duty cycle varies according to the output current.

I2 Output cutting current
I1 Input Amps absorbed corresponding to different output levels (I2).
U2 Secondary voltage with cutting current I2.
U1 Nominal supply voltage

IP21. Machine case protection class. The 1 in the second digit place means that this unit is not fit to work outdoors in the rain.

F Insulation Class
**NOTE:** This machine has also been designed to work in class 3 pollution areas.

### 3 INSTALLATION

#### 3.1 SETUP

Place the machine in a ventilated area.
Dust, dirt, or any other foreign material that might enter the machine may restrict the ventilation which could affect the machine’s performance. Fasten the rotating support to the machine top and fix the handle, the wheeles, the bottle support and, if any, the cooling unit.

#### 3.2 INPUT POWER CONNECTIONS

All sections concerning the installation of this machine must be read carefully.
This machine must be installed by skilled personnel.
Make sure that the input power plug has been disconnected before inspecting, maintaining, or servicing.
Connect the yellow-green wire to a good electrical ground.
**Do not use water pipes as earth conductor.**

This machine must never be used without the top and side covers. This is both for obvious safety reasons and to avoid interference with the machine’s internal cooling system. The warranty is to be considered null and void it this machine is used without the protection of its top and side covers.

This machine is wired for 120VAC @ 50/60Hz input power only.

This machine is wired for 120VAC @ 50/60Hz input power only.
3.3 OUTPUT CONNECTIONS

3.3.1 Connecting the work return lead clamp.
Insure that the ground clamp is tightly fastened to the work return cable and periodically check that this connection remains well tightened. A loose connection can cause weld current drops or overheating of the work return lead and clamp which, in turn, creates the risk of burns from accidental contact with the work return lead. The weld circuit must not be placed deliberately in direct or indirect contact with the ground conductor if it is not in the work to be welded.

If the work to be welded is attached deliberately to the ground by a protection lead, then the connection must be the most direct possible and it must be done using a lead that has a cross section that is at least equal to the cross section of the work return lead being used for the weld circuit. The protection lead must also be attached to the work at the same spot as the work return lead. To do so, a second ground clamp, fitted to the protection lead, must be attached next to the ground clamp of the work return lead.

3.3.2 Connecting the gas hose.
Keep the cylinders in an upright position by chaining them to their support.
Keep the cylinders in a place where they cannot be damaged.
Keep the cylinder away from the welding area and uninsulated electric circuits.
Cylinders containing inert gas have to be equipped with a pressure reducer and a flowmeter.
After having positioned the cylinder, connect the gas hose that comes out from the rear of the machine to the pressure reducer output.
Regulate the gas flow to 8-10 L/min.

4 DESCRIPTION OF CONTROLS

4.1 CONTROLS ON GENERATOR FRONT PANEL

A: Over heated pilot of main transformer (red) Light up while over duty cycle
B: Power switch: Turn on/off
D: Adjustable feeding wire knob: Adjust the speed of feeding wire (The larger the number, the faster the feeding wire.)
E: Weld voltage switch:
   The switch adjusts the weld voltage range
F: The torch
G: Work return lead
4.2 CONTROLS ON GENERATOR REAR PANEL

A: Gas pipe connector
B: Input power cable (Confirm the power voltage before use)

5 WELDING

5.1 INSTALLATION AND STARTER
Machine installation must be done by a competent staff. All connections must correspond to the rules in force and must respect laws concerning accidents.
Check that the wire diameter corresponds to that indicated on the roll and mount the wire coil.
Connect the pipe coming out of the extension with the cylinder flowmeter.
Position the welding machine so as to allow free air circulation inside it and avoid that metal or any other.

5.2 THE MACHINE IS READY TO WELD
Connect the ground terminal to the part to be welded.
Turn the machine on.
Extract the conic gas nozzle by rotating it clockwise.
Unscrew the current nozzle.
Press the torch trigger to feed the wire until it comes out from the torch.
WARNING: Keep your face away from the terminal nozzle while the wire comes out.
Screw the current nozzle again, making sure that the hole diameter be the same as that the wire used.
Insert the welding conic gas nozzle by rotating it clockwise. Open the gas cylinder and adjust
flowmeter at 8-10L/min.

**WARNING:** Check that the gas used is compatible with the material to be welded.

### 5.3 WELDING CARBON STEELS.

To weld carbon steels the following things are necessary:

1) The use of a binary shielding gas which is most commonly Argon and Carbon dioxide, in a ratio of 75-80% Argon and 25-20% Carbon dioxide. Some applications, however, may require a mix of three gases: Argon, Carbon dioxide (CO₂), and dioxide (O₂). These gas mixtures generate heat during welding and as a result the weld bead will be well filleted and neat in appearance. The penetration, however, will not be deep.

The use of Carbon dioxide as the shield gas results in a narrow weld bead with deep penetration but the ionization of the gas will have an influence on arc stability.

2) The use of a filler wire of the same quality as the steel to be welded. It is recommended that high quality wires be used and that welding with rusted wires be avoided because they can give rise to defects in the weld bead. Generally, the current range within which a wire can be used is calculated in the following manner:

\[ \text{Ø of wire} \times 100 = \text{minimum number of Amperes.} \]

\[ \text{Ø of wire} \times 200 = \text{maximum number of Amperes.} \]

Practical example: 1.20 Ø wire = 120 Amps minimum and 240 Amps maximum. These amperages are based on the use of an Argon/CO₂ mixture as the shield gas and welding in the Short Arc transfer mode.

3) Avoid welding on rusted work pieces or work having spots of oil and grease present on the surface.

4) The use of a welding torch suitable to the welding currents that are going to be used.

5) Periodically check that the two handles making up the ground clamp are not damaged and that the welding cables (torch cable and the work return lead) do not have any cuts or burn marks that would reduce their efficiency.

### 5.4 WELDING STAINLESS STEEL

Welding stainless steels in the 300 series (the austenitic series) must be done using a shield gas mixture of predominantly Argon with a small percentage of O₂ added to stabilize the arc. The recommended mixture is AR/O₂ in the ratio of 98/2. Do not use CO₂ or AR/CO₂ mixtures as the shield gas.

Do not touch the welding wire with your bare hands.

The filler metal (the wire) must be of a higher quality than the work to be welded and the weld area must be clean.

### 5.5 WELDING ALUMINIUM

The following is required for aluminium welding:

1) 100% Argon as welding protection gas.

2) A torch wire of composition suitable for the basic material to be welded.

For ALUMAN welding wire 3.5% silicon.
For ANTICORODAL welding wire 3.5% silicon.
For PERALUMAN welding wire 5% magnesium.
For ERGAL welding wire 5% magnesium.

3) A torch prepared for aluminium welding.
If you only have a torch for steel wires, the same shall be modified in the following way:
- Make sure that length of torch cable does not exceed 118 inches (it is advisable not to use longer torches).
- Remove the brass sheath-holding nut, the gas and the current nozzles, then slip the sheath off.
- Insert the teflon sheath for aluminium and ensure it protrudes from both ends.
- Screw the current nozzle so that the sheath adheres to it.
- Insert the sheath holding nipple, the O-Ring in the free end of the sheath and secure with the nut without tightening too much.
- Slip the brass tube on the sheath and insert both into the adapter (after removing the iron tube which was fitted inside the adaptor).
- Cut the sheath diagonally so that it stays as close as possible to the wire slide roller.

4) Use drive rolls that are suitable for aluminium wire. The drive rolls, when being installed, must be tightened as tight as possible.

5) Use contact tips that are suitable for aluminium wire and make sure that the diameter of the contact tip hole corresponds to the wire diameter that is going to be used.

6) Use abrasive grinders and tool brushes specifically designed for aluminium. Never use these tools on other materials. REMEMBER that cleanliness equals quality.

The wire spools must be stored in plastic bags with a dehumidifier.

6 WELDING DEFECTS

1- DEFECT- Porosity (in, or on the surface of the weld bead)
CAUSES
- Bad wire (rust on the surface).
- Insufficient gas shielding due to:
  - Inadequate gas flow due to a block in the gas line.
  - Defective flowmeter.
  - Gas regulator covered with frost because a gas heater was not used to heat the CO2 shielding gas.
  - Failure of gas valve solenoid.
  - Gas nozzle plugged up with spatter.
  - Gas flow holes plugged up.
  - Air drafts in the welding area.

2- DEFECT- Shrinkage Cracks
CAUSES
- Welding wire or work to be welded dirty or rusty.
- Weld bead too small.
- Weld bead too concave.
- Too much weld bead penetration.

3- DEFECT- Lateral cracking
CAUSES  Welding speed too fast.  
Low current and high arc voltages.
4- DEFECT-  **Too much Spatter**  
CAUSES  Voltage too high  
Insufficient impedance  
No gas heater used for CO2 shielding gas.

**7 MACHINE MAINTENANCE**  
**Gas nozzle**. Periodically clean the nozzle of all weld spatter that may have accumulated during welding operations If the nozzle should become distorted then it must be replaced. 
**Contact tip**. A good contact between the contact tip and the wire ensures a stable arc and optimal current output. Therefore, following steps must be followed:
A) The contact tip hole must be kept free of dirt or oxidation.
B) After lengthy welds, spatter can easily accumulate on the contact tip and prevent the wire from being fed. The contact tip must be cleaned regularly and if necessary it must be replaced.
C) The contact tip must always be screwed tightly on to the body of the torch. The thermal cycles which the torch undergoes during operation may loosen the contact tip which, in turn, may cause the torch body and nozzle to overheat or cause unsteady wire feed. 
**The Wire Liner** is an important part that must often be checked since, during normal operations, the wire can deposit copper dust or tiny metal shavings in the lining. Periodically clean the liner and the gas line with a jet of dry, compressed air. Wire liners are exposed to continual wear and therefore they must be replaced after a certain period of time. 
**Wire feed motor.** Periodically clean the wire feed assembly and the drive rolls from any rust or metal shavings due to the feeding of the wire. A periodic check of all the components of the wire feed assembly, spool holder, drive rolls, wire liner and the contact tip is recommended.  

**8 TROUBLESHOOTING**

**Note: All repair work must be done by qualified personnel.**

Disconnect the power input cable from the mains supply before replacing cables or before removing the unit covers. The machine is equipped with a thermostat that shuts the machine down when the power source overheats. After the thermostat intervenes, let the power source cool down for several minutes before resuming welding operations.

The troubleshooting table lists troubles, causes and remedies for those troubles that occur most commonly.

**9 Welding machine servicing**

Experience has shown that many accidents originated from servicing improperly executed. For this reason, a careful and thorough inspection on a serviced welding machine is just as important as one carried out on a new welding machine.

**Machine should be serviced by trained welding professional only…please contact your Dealer for repair locations.**
